                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-IC11. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, colon carcinoma system tumour, ovarian carcinoma, neuroblastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      endothelial growth factor (VEGF) antagonist activity. The antibor of a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce anti-angiogenic molecule and a chemotherapeutic agent, to produce
New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                    Complementarity determining region; CDR; CDRH2; antigen; cytostatic; angiogenesis inhibitor; vascular endothelial growth factor receptor; VEGF; tumour; leukaemia; antibody; cell proliferation inhibitor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC complex of two polypeptides (PI) and two second polypeptides (P2) which CC are stably associated in an immunoglobulin like complex. PI has an CC antigen-binding site located to the N terminus of immunoglobulin (Ig) CC light chain constant domain (CL domain), and P2 has an antigen-binding CC site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting anglogenesis; CC reducing endothelial cell proliferation, inhibiting vEGF induced CC migration of human leukaemia cells; blocking interaction of a protein and CC its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment CC methods. The design of (I) provides for efficient producction so that CC in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural CC is no requirement for processing in vitro to obtain the complete product. There complementarity determining region H2 (CDRH2) version #2 incorporated conton anatigen-binding protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                  The invention relates to a novel antibody having a first antign binding site specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a mouse peptide relating to the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DB BB

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score

TISSUE SPECIFICITY: LOCALIZED AT TIGHT JUNCTIONS OF BOTH
EPITHELIAL AND ENDOTHELIAL CELLS.
DOMAIN: THE C-TERMINAL IS CYTOPLASMIC AND IS IMPORTANT FOR
INTERACTION WITH ZO-1. NECESSARY FOR THE TIGHT JUNCTION
LOCALIZATION. INVOLVED IN THE REGULATION OF THE PERMEABILITY
BARRIER FUNCTION OF THE TIGHT JUNCTION (BY SIMILARITY).
PTM: PHOSPHORYLATED (BY SIMILARITY).
SIMILARITY: BELONGS TO THE ELL / OCCLUDIN FAMILY.

Nucleic Acids Res. 28:4317-4331(2000).

-!- FUNCTION: Is required not only for elongation of protein synthesis but also for the initiation of all mRNA translation through initiator tRNA(fMet) aminoacylation (By similarity).

-!- CATALYTIC ACTIVITY: ATP + L-methionine + tRNA(Met) = AMP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=20512582; PubMed=11058132;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CATALYTIC ACTIVITY: (5-L-glutamyl)-peptide + an amino acid peptide + 5-L-glutamyl-amino acid.

ENZYME REGULATION: INHIBITED BY GLUCOSE.

PATHWAY: GGT PLAYS A KEY ROLE IN THE GAMMA-GLUTAMYL CYCLE, PATHWAY: FOR THE SYNTHESIS AND DEGRADATION OF GLUTATHIONE.

SUBUNIT: THIS ENZYME CONSISTS OF TWO POLYPEPTIDE CHAINS, WHE SYNTHESIZED IN PRECURSOR FORM FROM A SINGLE POLYPEPTIDE (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DEVELOPMENTAL STAGE: EXPRESSED AT THE END OF VEGETATIVE GROWTH. SIMILARITY: STRONG, TO OTHER GGT ENZYMES AND TO GL-7ACA ACYLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBCELLULAR LOCATION: Secreted.
